Technical Writing and Support: Marjorie Nockels Ortiz  
Layout: Debbie Fields

Graphic Design: Nancy Reick, Kendall Printing

Funded by the Colorado Corn Growers Association/Colorado Corn Administrative Committee through a grant by the Colorado Department of Public Health and the Environment through a Section 319 Nonpoint Source Education Grant. Additional funding and support provided by the Agricultural Chemicals and Ground Water Protection Program at the Colorado Department of Agriculture.

Special acknowledgments to  
the following reviewers:

Bruce Bosley, Colorado State University Cooperative Extension  
Bill Brown, Colorado State University  
Grant Cardon, Colorado State University  
Wayne Cooley, Colorado State University Cooperative Extension  
Bill Curran, Pioneer Hi-Bred International, Inc.  
Ron Meyer, Colorado State University Cooperative Extension  
Frank Peairs, Colorado State University  
Calvin Pearson, Colorado State University  
Gary Peterson, Colorado State University  
Dwayne Westfall, Colorado State University  
Phil Westra, Colorado State University

Issued in furtherance of Cooperative Extension work, Acts of May 8 and June 30, 1914, in cooperation with the U.S. Department of Agriculture, Milan A. Rewerts, Director of Cooperative Extension, Colorado State University, Fort Collins, Colorado. Cooperative Extension programs are available to all without discrimination. To simplify terminology, trade names of products and equipment are occasionally used. No endorsement of products mentioned is intended nor is criticism implied of products not mentioned.

# Soil Fertility

Figure 14. Essential elements for plants are required in varying quantities. For example, a bushel of corn removes approximately 0.8 lbs nitrogen, but only 0.001 lbs of zinc - an 800 fold difference.

Graphic modified from the International Fertilizer Industry Association.

<b>N</b> Nitrogen	<b>Mg</b> Magnesium
<b>P</b> Phosphorus	<b>Mo</b> Molybdenum
<b>S</b> Sulfur	<b>Mn</b> Manganese
<b>K</b> Potassium	<b>Cu</b> Copper
<b>Zn</b> Zinc	<b>B</b> Boron
<b>Fe</b> Iron	<b>Ni</b> Nickel
<b>Ca</b> Calcium	

Corn plants require at least 16 nutrients in sufficient quantities for proper nutrition (Figure 14.) Using the sun's light and heat as an energy source, the corn plant is a living factory that uses nutrients to build simple sugars into more complex molecules for all its functions.

Corn plants obtain carbon, oxygen, and hydrogen from the atmosphere and from water and air in the soil. Other nutrients are absorbed by plant roots from the soil. Fortunately, only two to five of these nutrients are needed in supplemental quantities through fertilization or manure in Colorado. The remainders are supplied from the weathering of soil minerals, organic matter mineralization, irrigation water and rainfall.

The key to profitable fertility management in corn production is determining what additional nutrients are required to maximize efficient grain or silage production. As Figure 15 shows, the most profitable fertilizer rate is not always the one that gives maximum yield. The most reliable way to determine this rate is through soil sampling, and laboratory analysis (soil testing).

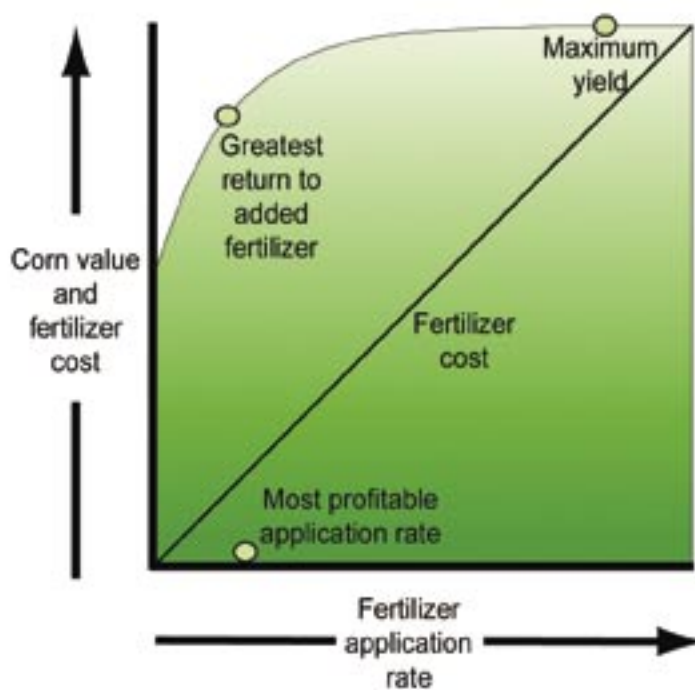

Figure 15. For most added fertilizer nutrients, corn yield increases rapidly at first and then levels off. The most economical yield is often not the maximum achievable yield and will depend upon the corn and fertilizer price.
