Fremont County Producers

MP-88.1

University of Wyoming - August, 1994

This enterprise budget presents estimated typical costs and returns for alfalfa hay in the Riverton area of Wyoming. Data presented are not taken from an actual farm situation. A panel of Fremont County producers assisted in outlining the “representative” farm situation described by the budget. Thus, the budget provides a guide to determining costs and returns for specific operations. Production practices presented in the budget are not necessarily “best” management practices. The major assumptions used in this budget are presented below.

### LAND

The budget is based on a 480 acre farm, with 200 acres of alfalfa hay grown each year. Other enterprises included on this farm are: alfalfa establishment, 40 acres; dry beans, 40 acres; sugar beets, 120 acres; feed barley, 50 acres; and 273 head of cattle grazed on crop aftermath. The remaining 30 acres include roadways, fence lines, and farmsteads. All owned land is valued at \$800 per acre. Leased land is rented on a cash-lease basis for \$75 per acre. The land owner pays for irrigation water, taxes, insurance, long term interest, and depreciation for owned land and improvements.

### LABOR

Labor is provided by the operator and one full-time employee. All labor, including operator labor, is valued at \$5 per hour plus 7.65 percent to cover social security and federal withholding taxes. Labor charges for the owner/operator represent an opportunity cost for the time spent in this enterprise.

Some part-time labor may be used on the farm for labor-intensive operations such as harvest.

### CAPITAL

The operator provides 50 percent of the long-term capital and 50 percent of the operating capital for this enterprise. Fifty percent of the long-term capital is borrowed at an interest rate of 8.0 percent APR (Annual Percentage Rate). Fifty percent of the operating capital is borrowed at an interest rate of 8.5 percent APR. The interest rates used here are for short-term planning. Real interest rates (interest rates adjusted for expected inflation) should be used for accurate long-term planning.

### ESTABLISHMENT COSTS

This budget estimates the cost of producing alfalfa hay from an existing alfalfa stand. Costs of establishing the alfalfa stand are estimated in a separate alfalfa establishment budget. Establishment costs are included in the alfalfa hay budget as an alfalfa stand charge, found in the fixed cost section.

Establishment costs are estimated assuming the alfalfa stand is established with an oat and field pea companion (nurse) crop at the rate of 40 acres each year.

### MACHINERY, EQUIPMENT, AND BUILDINGS

A complete list of the machinery, equipment, and buildings used in this enterprise and the associated values are provided in Table 1. All resources are assumed to be half depreciated. Estimated operating and ownership costs are given in Table 3. Table 3 lists only the resources used in

this enterprise. Other resources used on the farm are not included. However, the reader should note that the resources listed in Tables 1 and 3 may also be used in other enterprises on the farm.

Each irrigated acre on the farm is assumed to be irrigated by a fraction of the total irrigation system. The irrigation water provided by each irrigation system is broken down as follows: 18 percent concrete ditch and 82 percent gated pipe (50 percent aluminum and 50 percent plastic). This method was employed because crops will normally be rotated onto all farmed land over time. Table 2 presents an estimate of the cost per acre-inch for providing irrigation water for each type of irrigation.

## OPERATIONS

Operations related to alfalfa hay are listed in chronological order in the enterprise budget. Ground preparation begins in early March, including stand fertilization. Irrigation usually starts the first of May, with a total of four irrigations applied over the growing season. A total of 56 acre-inches of water is delivered per acre of growing alfalfa.

Typically three cuttings of hay are harvested: in mid June, late July, and early September. The first two cuttings of hay are cut and custom baled in large-square bales. These bales are then hauled and stacked within a mile of the field. The third cutting is cut, baled in small square bales, and custom stacked. The first two cuttings yield two tons per acre each, while the third yields one ton per acre.

## ENTERPRISE BUDGET

Economic costs and returns for alfalfa hay are summarized by operation in the enterprise budget. Costs are broken down by stage of production. General overhead and operator management have been calculated at 5 percent and 10 percent of all cash costs, respectively.

Costs and returns for the cash lease arrangement are also summarized in the budget. Costs paid/received by the tenant, including the cash land rent are listed in the tenant column. Items paid/received by the landowner, including the cash land rent income are included in the landowner column. The far right column has been provided to calculate changes from this base budget for your operation.

## SUMMARY

Gross income for the alfalfa hay enterprise is estimated at \$336.95 per acre. Total variable costs are estimated at \$170.12 per acre, with total fixed costs at \$122.27 per acre. The total of all costs for alfalfa hay is estimated at \$292.39 per acre, leaving a net projected return of \$44.56 per acre. The net projected returns for the lease arrangement are (\$31.06) per acre for the landowner and \$64.37 per acre for the tenant. As estimated in the alfalfa establishment budget, the cost of establishing the alfalfa stand totals \$21.48 per acre of growing alfalfa each year. These costs are estimated for a five year stand life assuming 40 acres of alfalfa establishment each year.
